ThinkPad SelectaDock III
User's Guide Supplement

If you are using the SelectaDock III docking station in Windows 98 environment, resuming normal operation from hibernation mode or suspend mode might take a long time. This is not a problem with the docking station.

If you have not attached a SCSI device to the docking station but have enabled the SCSI function, the docking station queries the SCSI device until the timeout timer is reached. You need to connect a SCSI device according to the instructions in the *User's Guide* or you need to disable the SCSI port as follows:

1 Start the ThinkPad Configuration program.

2 Click on **Docking Station**.

3 Click on **Device Manager...**.

4 Click on **SCSI controllers**.

   The SCSI devices are listed.

5 Click on the SCSI device name that is in the docking station.

6 Click on the **Properties** button.

7 Put a check mark in the **Disable in this hardware profile** check box by clicking on it.

8 Click on **OK**.
